IgA Testing – Clinically Useful

IgA antibodies are part of our immune defense. They are present in our saliva, intestinal fluids and blood. Elevated serum IgA antibodies are thought to reflect gut inflammation that may consequently allow for increased allergen exposure. Specific-IgA levels increase when the immune system responds to the allergen, for example, our foods. Serum IgA levels are frequently raised in rheumatic diseases and other autoimmune conditions as well as liver disease and persistent infections. The relationship between food and multiple sclerosis is especially intriguing. [read more...](#)
